

## DMV003 DMetashell & Phoscript Stack Machine

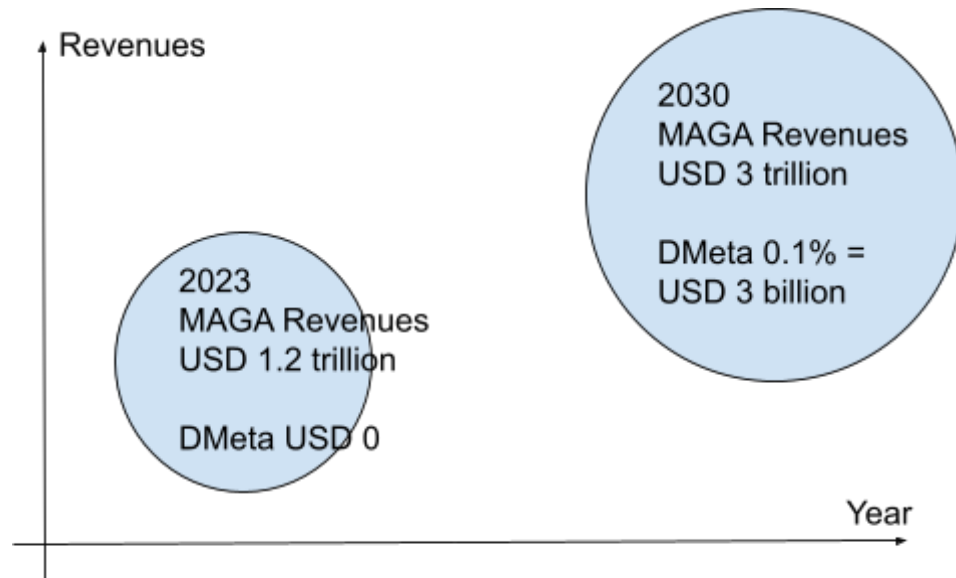

Figure 1: Projection of Revenues

In a previous article, we demonstrate how we may build a “Decentralised Metaverse” owned and operated by individual users and programmers, which may generate revenues of at least USD 3 billion by 2030, using a CONSERVATIVE estimate of 0.1% of MAGA revenues, where MAGA refers to Microsoft, Meta, Amazon, Google, Apple, although the acronym is a funny collision with the political one, as shown in figure 1.

- [https://godmeta.github.io/doc/DMV002\\_Build\\_Decentralised\\_Metaverse\\_DMetashell.pdf](https://godmeta.github.io/doc/DMV002_Build_Decentralised_Metaverse_DMetashell.pdf)

<prototype>: Array []
>> f(': B_F hgje echo ; AJE')
```

Figure 2A

Figure 2A shows a browser console output screenshot of running DMetashell (figure 2B), hosted at a Virtualbox server, redirected via ngrok at:

- <https://godmeta.github.io/dmeta/>

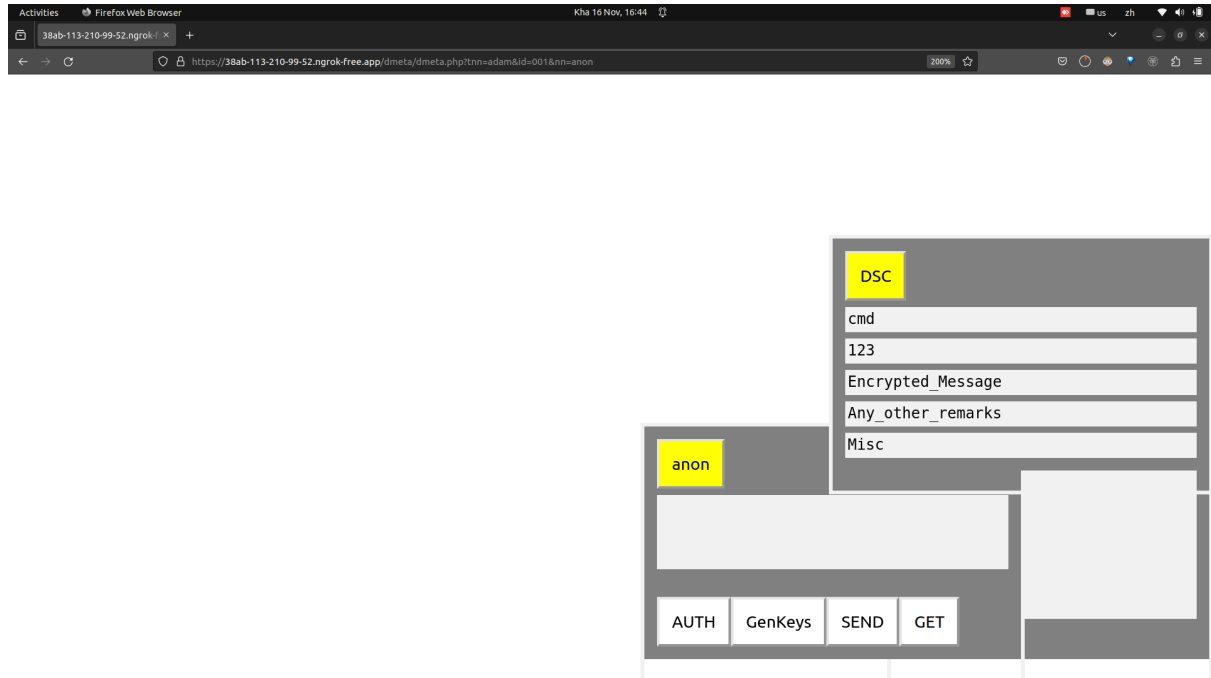

Figure 2B

The command entered via the browser console was:

```
f(' : B_F hgje echo ; \ backslash+space marks start of comment
```

f() is a JavaScript function to initiate DMetashell, which in turn executes commands contained in the string. DMetashell runs Phoscript, a metaprogramming script derived from the FORTH programming language.

```
 : B_F hgje echo ; \ backslash+space marks start of comment
 \ : .... ; colon and semicolon enclose a "word definition"
 \ word in FORTH means function name
 \ B_F is the function name
 \ "hgje echo" are the subroutines in function B_F
```

```

hongwu@hongwu-Latitude-5480:~/devel/2023/02/dmeta/auth$ cat o_cdw.json | sed 's/[,/],\n/g'
```

Figure 3

The definitions of hgje and echo are given in o\_cdw.json, where cdw means “colon definition words”, as shown in figure 3:

```
"hgje":["ON","ECHO","bv":"hgnc","array":"map","nop":"je":"",""],
"echo":["ON","ECHO","bv":"ec":"",""],
```

o\_cdw.json simply stores FORTH style colon definitions in JSON format.

Of these, the crucial functions are hgnc: which is mapped to fgl\_hgnc() as shown in figure 4.

```
Activities Text Editor Kiba 16 Nov, 00:14 libhash.php
~/devel/2023/02/dmeta/auth Save
44 global $S;
45 exec( "grep --color=always -r 2023 Graph/hg | sort -k1.30", $m);
46 $S[]=$m;
47 }
48
49 function fgl_hgnc() // grep -r 2023 Graph/hg no color
50 {
51     global $S;
52     exec( "grep -r 2023 Graph/hg | sort -k1.30", $m);
53     $S[]=$m;
54 }
55
56 function fgl_exec() // exec
57 {
58     global $S;
59     exec( array_pop($S), $m);
60     $S[]=$m;
61 }
62
63
64 function fgl_hist() // history
65 {
66     global $S;
67     exec( "history", $m);
68     $S[]=$m;
69 }
70
71 function fgl_man() // keyword man: manuals, from rg:
72 {
73     global $S;
74     // echo " in open: "
```

Figure 4

fgl\_hgnc() is a PHP function which in turn executes "grep -r 2023 Graph/hg | sort -k1.30" which recursively displays all lines containing keyword 2023 in the subdirectory Graph/hg, then piped to a sort function. The output is shown in figure 2.

echo in turn calls ec: which is mapped to fgl\_ec() in figure 5, which outputs the “top of stack” (TOS) item by calling PHP function echo in line 286.

```
273     $S[] = $i;
274     fgl_esx();
275     fgl_s();
276     break;
277 }
278 $vk = $i + 1;
279 }
280 function fgl_ec()
281 {
282     global $S, $BV;
283     if (isset($BV['ECHO'])) {
284         if ($BV['ECHO'] == "ON") {
285             $E = array_pop($S);
286             echo $E;
287             file_put_contents('o_echo.txt', $E);
288         } else {
289             array_pop($S);
290         }
291     } else {
292         array_pop($S);
293     }
294 }
295 function fgl_ecx()
296 {
297     global $S;
298     echo end($S);
299 }
300 function fgl_i()
301 {
```

94S.splice(1,0,S[1])
```

## Figure 6

The definitions of AJE are given in lines 86 and 88 of figure 6. Readers may refer to the code for detailed explanations. We shall simply give a summary here, where AJE is simply an AJAX function that stores the output from the backend (echo) on the top of stack in the front end, which was displayed in figure 2.

From the discussions above, readers may conclude that DMetashell consists of Phoscript stack machines running in BOTH the front end and back end. This is a breakthrough in web programming as we have now unified both front end and back end with ONE metaprogramming script, simplifying the learning curves for junior as well as senior programmers (who may have to learn multiple programming languages).

Further, Phoscript and DMetashell can be implemented in the equivalent of around 20 lines of JavaScript in ANY known programming language. So it can be ported to mobile apps, mainframe legacy systems or any other old and new systems easily. As such, it is actually a universal solution for many software development problems.
